Install
GigaControl
in Microsoft Windows 8

Microsoft Windows 8 enforces digital driver signature verification at the kernel level and would not allow users to install anything without it. Most of the time Windows 8 would show a error message like "**A digitally signed driver is required**" & "**The driver installation failed**".

Thankfully, Microsoft has left an option to bypass the signature verification and install the device driver as usual. The procedure for installation of unsigned device drivers on Windows 8 is outlined below.

## Procedure to enable installation of GigaControl in Microsoft Windows 8 :

1. To get started move your mouse-cursor to the

   bottom right corner of the screen and click

   Settings from the Charms bar
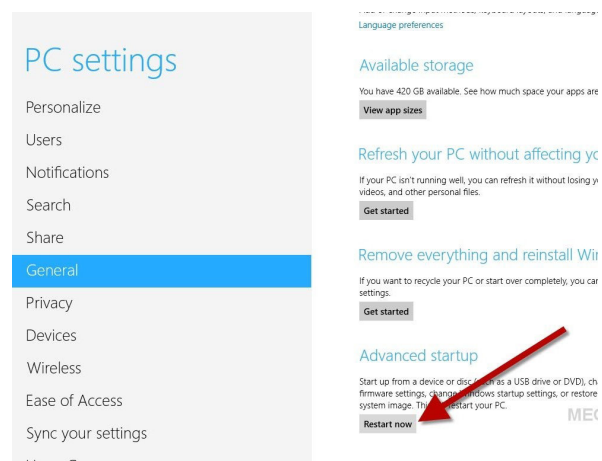

2. Now click "**Change PC Settings**".

3. Navigate to **General**

   and then scroll to the bottom for

   Advanced startup ->

   Restart now.

* lower right corner

5. Your computers will now restart and you have to chose "**Disable driver signature enforcement**". Use function key F7 to disable Windows 8 digital signature verification for driver installation for one single boot.
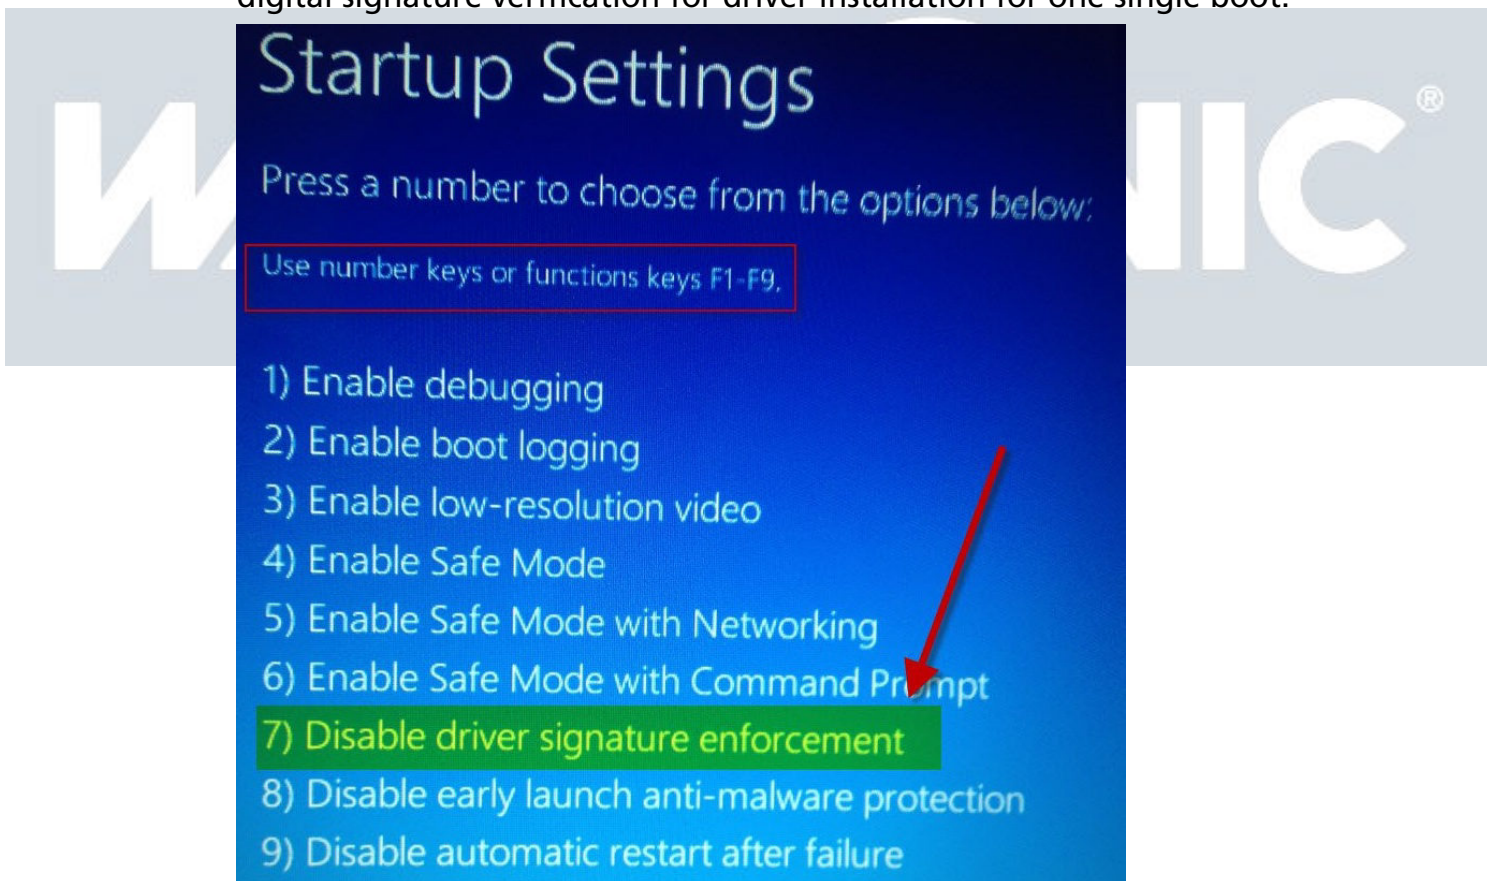

6. Now please install GigaControl without getting blocked, keep in mind this setting is enabled for a single boot and will get disabled after next reboot.
